cladistic study smithsonian series in comparative evolutionary biology the origin and early diversification of land plants a cladistic study smithsonian series in comparative evolutionary biology The Origin and Early Diversification of Land Plants - A Cladistic Study (Smithsonian Series in Comparative Evolutionary Biology):

The appearance of land vegetation on Earth 450 million years ago marked a period of unparalleled innovation in plant evolution The transition from algae to the first land plants the transition from water to air entailed adaptations that gave rise to many of today's major plant groups including mosses liverworts lycopsids and ferns An understanding of early land plant relationships is critical to a full scale appreciation of phylogenetic patterns in the plant kingdom remarkable a treasure of organized information about specific taxa and characters well posed phylogenetic questions addressed by the analyses of taxa and traits whose choices are carefully justified syntheses of molecular and morphological evidence
